Locator pins help prevent mounting the valve backwards and ensure proper alignment of the ports to the fluid passageways in the manifold. Pins prevent a 2-way valve from being mounted in the place of a 3-way valve and vice-versa.

Hit and Hold Specifications

Hit and Hold is a method for driving valves that can be used to reduce power consumption and heat generation while maintaining valve performance specifications. The valve is “hit” with the full rated voltage for some time period to open it (T1 in the graph) and then “held” open with substantially reduced voltage until the desired pulse length is reached (T2 in the graph). The following table shows the possible holding voltages and power consumption for our standard 12 and 24 VDC solenoids. A hit and hold circuit is required for use with the high pressure version.

Rated Voltage (VDC)	High Pressure Versions* 100 PSI (6.9 bar) & 40 PSI (2.8 bar) Max		Standard Versions 60 PSI(4.1 bar) & 20 PSI (1.4 bar)Max	
	Hold Voltage	Hold Power	Hold Voltage	Hold Power
24	12VDC	1.8 watts	12VDC	1.2 watts
12	6VDC	1.8 watts	6VDC	1.1 watts

*Requires hit and hold circuit
